

The Cavitation Slimming Equipment, combines the latest non-invasive technology and is currently one of the beauty industry's most popular international high-tech devices. It uses focused ultrasound technology, and mechanical wave technology to effectively break down body fat cells: shaping the body, improving facial contours, with lasting results.

The use of focused ultrasound energy on shattered fat cells after focused ultrasound can effectively shatter the fat cell membrane effectively, so it doesn't damage the other body tissues, like the nerves, blood vessels and skin. The broken fat cells pass through the blood and are excreted through the lymphatic system.

The mechanical wave can stimulate cell movement and elevate temperature, promoting cell metabolism and microcirculation.

Features:

- shaping face and body
- precise frequency, and comfortable care.
- the platform can be easily upgraded.
- the energy intensity can be adjusted.
- Internal and external modular design makes it easy to maintain.
- User-friendly interface and LCD touch screen.
